Commercial Dive Harness Care Instructions

AVOID CHLORINE, BLEACH AND HARSH CHEMICALS

- Do not use chlorine, bleach or harsh chemicals when cleaning your harness, as they can degrade the stitching and webbing.
- If needed, use a mild detergent to remove dirt, salt, and contaminants.

RINSE AFTER EACH USE AND DRY THOROUGHLY

- Rinse your harness thoroughly with fresh water after every dive, especially if you've been in saltwater. Salt residue can corrode hardware and degrade materials over time.
- Hang your harness to dry in a well ventilated area and avoid hanging it in direct sunlight as UV rays can degrade the material over time.

INSPECTION

- Perform regular inspections of your harness before and after each dive.
- Look for signs of wear, fraying, or damage in critical areas such as attachment points, buckles, and webbing.
- Check stitching for loose threads or unraveling.
- Ensure all hardware and fasteners are secure and functioning correctly.

PROPER DOCUMENTATION

- Maintain accurate records of your harness's usages and inspections.
- Include dates of dives, any issues or concerns, and inspectors.
- This documentation can help identify patterns of wear and ensure timely maintenance or replacement.

DISCONTINUE USE

- If you notice any signs of distress, damage, or wear that compromise the integrity of the harness, discontinue its use immediately.
- Do not attempt to repair it.
- Safety is everyone's concern.
